

00

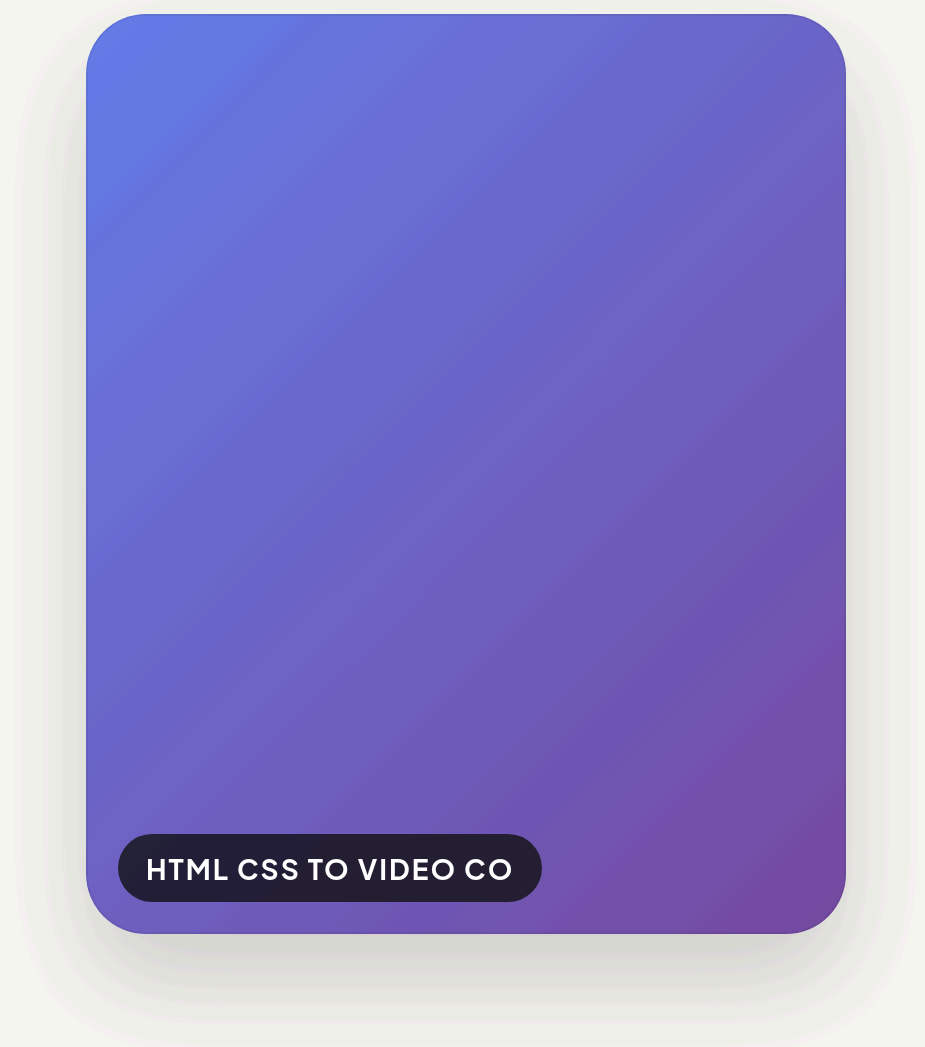

A video that was *never filmed*

01 · HTML CSS TO VID

Code becomes video. Pixel-perfect. *Every time.*

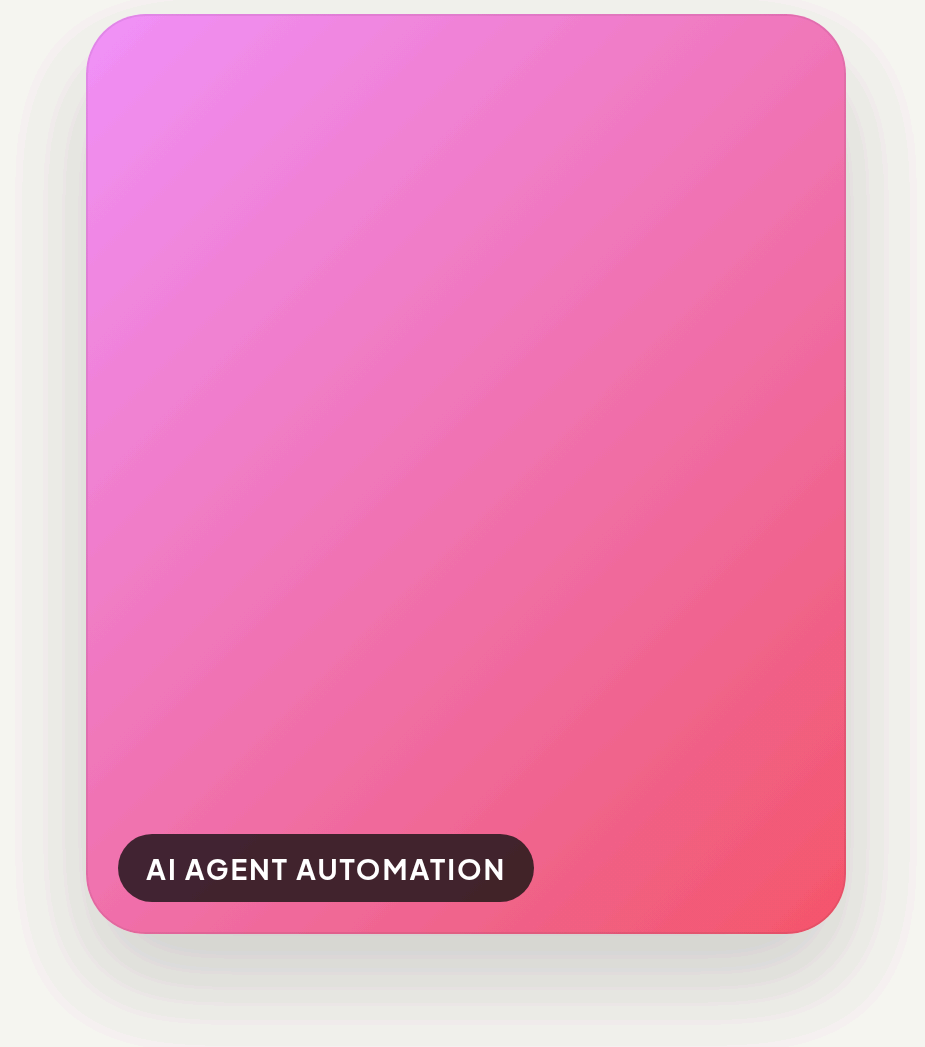

HeyGen's Hyperframes converts HTML and CSS directly into MP4 video files. No browser recording, no screen capture, no rendering pipeline. The code becomes the video. Deterministically, pixel-perfect, every time.

02 · AI AGENT AUTOMA

Built for AI agents, *not humans*

This was built specifically for AI agents. An agent writes HTML, runs Hyperframes, and gets back a video file. No human opens a browser. No GUI interaction. Pure code-to-video generation.

03 · COST DISRUPTION

\$15,000 video project for *nearly zero*

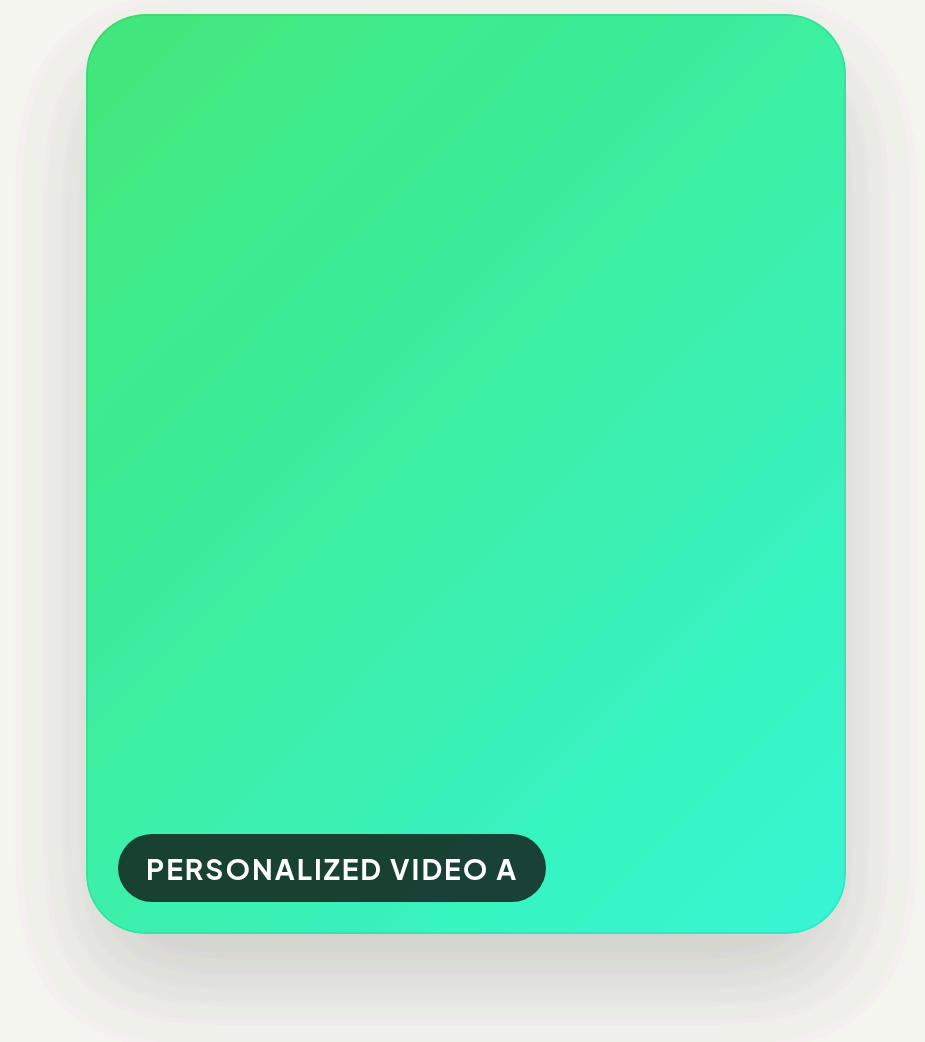

Marketing agencies currently charge \$3,000–15,000 for animated product videos. Hyperframes can generate the same output from a template and data feed in seconds. The cost drops to nearly zero.

COST DISRUPTION AGEN

04 · PERSONALIZED VI

10,000 personalized videos from *one template*

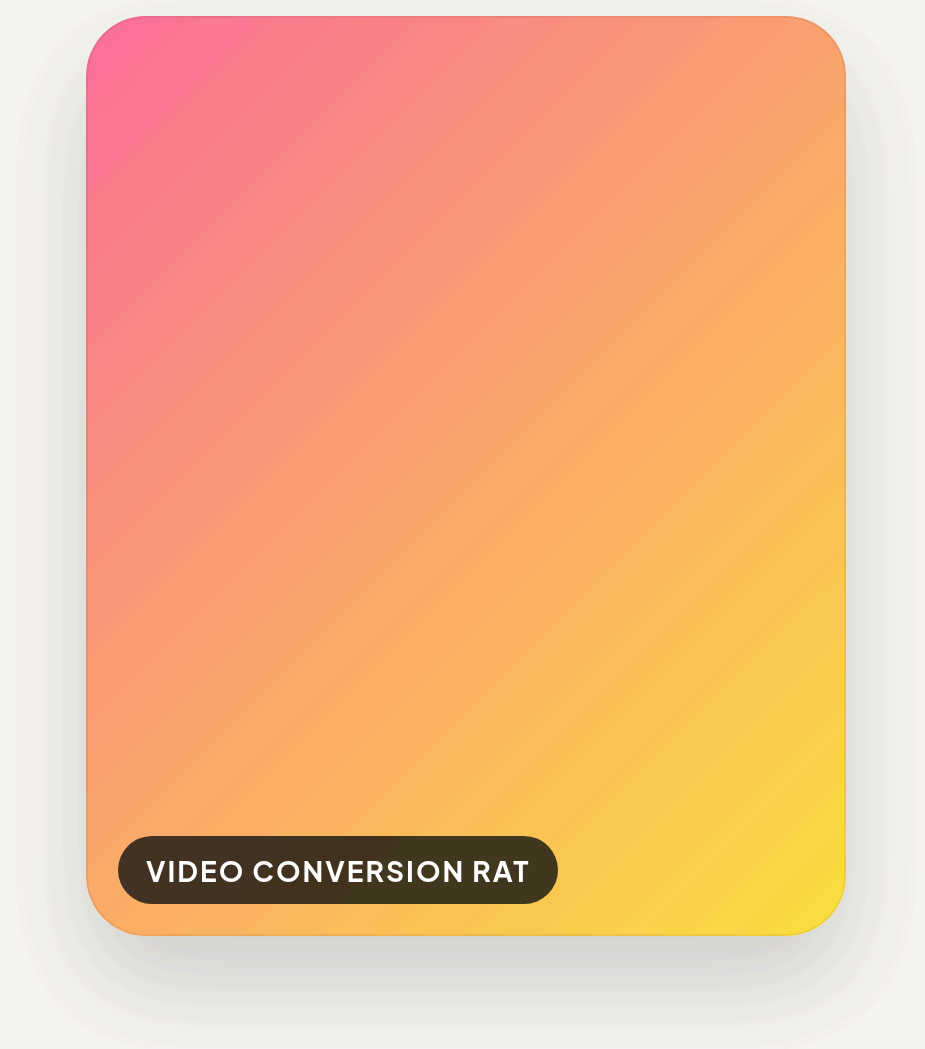

The real disruption: dynamic video at scale. Personalized videos for 10,000 customers, each with different names, products, and offers, generated from a single HTML template. Try doing that in After Effects.

05 · VIDEO CONVERSIO

Video becomes the default, not *the* *premium*

Static images and text are losing the attention war. Video converts 2–3× better across every platform. Hyperframes makes video the default output format, not a premium add-on.
