

00

What if every vulnerability had a *price tag?*

VULNERABILITY PRICE

SWIPE →

01 · CYBERSECURITY S

One search. Every exploit. *Instantly.*

Sploitas is a search engine built specifically for security researchers. Type a software version and get every known exploit, CVE, and vulnerability mapped to it. No more digging through 15 different databases.

02 · SPEED VULNERABI

3 seconds instead of *3 hours*

The average time to patch a critical vulnerability is 197 days. During that window, attackers are searching for the exact same exploits. Sploitas makes that search take 3 seconds instead of 3 hours.

SPEED VULNERABILITY

03 · SECURITY TEAM R

40% of security time wasted *on* *recon*

Enterprise security teams spend 40% of their time on reconnaissance: finding what is vulnerable, checking exploit availability, assessing real-world risk. A dedicated search engine cuts that time by 8–10x.

SECURITY TEAM RECONN

04 · CVE DATABASE RE

**23,000+ new
CVEs per year.
Tracked in *real time*.**

There are 23,000+ new CVEs published every year. No human can track them all. Sploitas indexes and cross-references them in real time, connecting exploits to affected systems automatically.

CVE DATABASE REAL TI

05 · DEFENDER VS ATT

Defenders finally match attacker *speed*

The offensive security community has been fragmented across dozens of forums, databases, and paste sites. A unified search engine changes the power dynamic. Defenders can now match attacker speed in vulnerability research.

DEFENDER VS ATTACKER
