

00

12ms to Index Your *Entire Codebase*

CODE INDEXING SPEED

SWIPE →

01 · CODE KNOWLEDGE

Your codebase as *a knowledge graph*

Codebase Memory MCP by DeusData turns any codebase into a persistent knowledge graph. Not a vector search. Not keyword matching. A structured graph where every function, class, and dependency is mapped to every other piece of code it touches.

CODE KNOWLEDGE GRAPH

02 · CODE SEARCH VS

Searching vs *understanding*

Traditional code search tools return file paths and line numbers. Codebase Memory returns relationships. "This function is called by 14 other functions, modified 3 times in the last sprint, and has 2 known edge cases." That's the difference between searching and understanding.

CODE SEARCH VS UNDER

03 · CODEBASE INDEXING

**100K lines in
50ms. 1M lines *in*
*200ms.***

The indexing speed is what makes this practical for daily work. A 100,000-line codebase indexes in under 50ms. A million-line monolith takes about 200ms. No waiting. No background jobs. Ask a question about your code and get a graph-based answer instantly.

04 · AI CODING BUG R

35% fewer AI coding *bugs*

AI coding assistants with Codebase Memory MCP write 35% fewer bugs on large codebases. The reason is direct. When your AI understands the dependency graph, it stops making changes that break unrelated modules. Context eliminates the most common class of AI coding errors.

AI CODING BUG REDUCT

05 · MCP SERVER SETU

2 minutes to full *codebase awareness*

Setup takes 2 minutes. Install the MCP server, point it at your repo, and your AI assistant gains persistent codebase awareness. No re-indexing on every prompt. The knowledge graph lives in memory and updates incrementally as your code changes.
